

**Computer Science Department**  
**Web Application and Technologies (COMP 334)**  
**Second Semester 2025/2026**

**Assignment 1: Static Website Development Using HTML5**

***Due Date 04/05/2026***

## 1. Overview

In this assignment you will design and build a **multi-page static website** for a fictitious online store that markets **Palestinian souvenirs** to international customers. Typical products include, but are not limited to, handcrafted ceramics, natural olive-oil products, traditional Palestinian food items, embroidery, and olive-wood carvings.

The assignment focuses on **HTML5 only**. You must **not** use CSS stylesheets, JavaScript, or any server-side scripting. All visual presentation is produced by the browser's default rendering of well-structured, semantic HTML5.

**⚠ Important:** Plagiarism check: if your pages are found elsewhere on the web, or are substantially copied from another student's submission, you will receive a mark of zero.

## 2. Learning Objectives

By completing this assignment, students will be able to:

- Structure a multi-page website using HTML5 semantic elements.
- Apply a comprehensive set of HTML5 elements in contextually appropriate ways.
- Build accessible web forms using proper labelling and for attributes.
- Use relative URLs consistently for internal links and resources.
- Validate HTML5 documents against the W3C specification.

### 3. Required HTML5 Elements

You must use **only** the *elements discussed in the lectures and the textbook* across your pages. For each element, you must choose the page and context where it makes genuine semantic sense — do not add elements arbitrarily just to satisfy the list.

**Note:** You decide which element to use where. The marker will assess whether your choices reflect genuine understanding of each element's semantic purpose.

### 4. Pages Required

Your website must contain the following **five pages**, saved inside a sub-folder named **ass1/**.

#### 4.1 Store Home Page — index.html

The home page is the front door of your store. It must:

- **Introduce the store** — give it a unique fictitious name (verify the name is not already used on the web), describe what it sells, and explain why international customers should choose it over competitors.
- **Promote the store** — include engaging textual content and at least one image or graphic that supports the store's identity.
- **Showcase product categories** — provide a brief overview of each product category sold, with a link to the relevant product page.
- **Link to Assignment 1 index** — add a link on this page that points to your Assignment 1 index file.

Save as **ass1/index.html**.

#### 4.2 Product Pages — product1.html and product2.html

Create two separate static HTML pages, each marketing one specific product. Each product page must include:

- **Product name** — clearly displayed as a heading.
- **Product description** — a detailed paragraph describing the item, its origin, materials, and what makes it special.
- **Price** — stated clearly in USD.
- **Product image** — at least one image of the product, wrapped in a **figure** element with a **figcaption**.
- **Specifications table** — a **table** listing key product attributes (e.g., dimensions, weight, material, origin).
- **Customer ratings and reviews section** — include an overall rating summary and at least three individual customer reviews, each in its own **article** element.

### 4.3 Contact Us Page — contact.html

This page provides customers with ways to reach the store and a form to send a message. It must include:

- **Contact information** — correspondence address, telephone number, and email address, marked up with the `address` element.
- **Contact form** — see Section 5 for full form requirements.

### 4.4 Customer Registration Page — register.html

This page allows new customers to create an account. The form must use `method="post"` and submit to:

<http://comp334.studentswebprojects.ritaj.ps/util/process.php>

See Section 5.2 for full form field requirements.

## 5. Sitewide Requirements

### 5.1 Header and Navigation

Every page must include a sitewide header, marked up with the semantic `header` element, containing:

- The store name — as the top-level heading (h1).
- The store logo — an `img` element with an appropriate alt attribute.
- A navigation menu — a `nav` element containing links to all five pages of the site.

### 5.2 Footer

Every page must include a sitewide footer, marked up with the `footer` element, containing:

- The date the page was last updated.
- The store's postal address.
- Customer support details: telephone number, email address.
- A link to the Contact Us page.

**Requirement:** The footer must always appear at the bottom of each page, regardless of how much content the page contains.

### 5.3 Forms and Accessibility

Both forms in this assignment (Contact Us and Registration) must follow the accessibility requirements below. Marks will be deducted for any form control that is missing its accessibility attributes.

### 5.3.1 Contact Us Form (contact.html)

The form must collect the following fields:

1. Sender Name — text input
2. Sender Email — email input
3. Sender Location (city) — text input
4. Message Subject — text input
5. Message Body — textarea
6. Send button and Reset button

### 5.3.2 Customer Registration Form (register.html)

The registration form must collect at minimum the following fields, grouped logically using fieldset and legend:

- **Personal Information:** First Name, Last Name, Email, Phone
- **Address:** Street Address (textarea), City, Postal Code, Country (select drop-down)
- **Account:** Password, Confirm Password
- **Submit button**

### 5.3.3 Accessibility Attributes Required on All Form Controls

| Attribute / Element | Requirement                                                                                               |
|---------------------|-----------------------------------------------------------------------------------------------------------|
| label + for         | Every input, select, and textarea must have a label element whose for attribute matches the control's id. |
| placeholder         | All text-entry fields must include a placeholder showing the expected format or an example value.         |
| fieldset + legend   | Related groups of fields must be wrapped in a fieldset with a descriptive legend.                         |
| required            | Mandatory fields must carry both the HTML required attribute.                                             |
| id                  | For attribute must have a matching id attribute.                                                          |

## 6. Technical Requirements

### 6.1 Semantic Markup

Use the correct semantic HTML5 element for every piece of content. In particular:

- Use **article** for self-contained pieces of content such as individual product cards or customer reviews.
- Use **section** to group related content within a page.
- Use **figure** and **figcaption** for all images that require a caption.
- Use **details** and **summary** for any expandable / collapsible content (e.g., FAQs).
- Use **address** only for contact information, not as a generic block element.
- Avoid generic **div** and **span** elements unless no suitable semantic element exists.

## 6.2 Relative URLs

You must use **relative URLs** for all links to pages, images, and other resources within your own site. Absolute URLs are only acceptable for external resources (e.g., referencing a live server endpoint).

## 6.3 HTML Validation

All five pages must pass W3C validation with **no errors**. Validate your work at:

<https://validator.w3.org/>

Common validation requirements to keep in mind:

- All **img** elements must include an **alt** attribute.
- All **html** elements must include a **lang** attribute.
- All pages must begin with **<!DOCTYPE html>**.
- All opened tags must be properly closed.
- All attribute values must be enclosed in quotation marks.

## 7. Deliverables and Submission

Submit a single compressed archive (.zip) to the **ITC** containing the ass1/ folder with the following structure:

| File / Folder      | Description                                   |
|--------------------|-----------------------------------------------|
| ass1/index.html    | Home page                                     |
| ass1/product1.html | Product page 1                                |
| ass1/product2.html | Product page 2                                |
| ass1/contact.html  | Contact Us page                               |
| ass1/register.html | Customer Registration page                    |
| ass1/images/       | Folder containing all images used in the site |

**⚠ Important:** All pages must be tested in a browser before submission. Broken links, missing images, or pages that do not render will result in mark deductions.

### Live Website:

- Your personal home page must be live and accessible at:  
[http://web{STUDENT\\_ID}.studentswebprojects.ritaj.ps/](http://web{STUDENT_ID}.studentswebprojects.ritaj.ps/)
- All folder structure must be properly set up on the CS host, see folder structure below
- All navigation links must be working

## Structure Your Website Folder

You need to take the following steps to structure your web folder effectively:

1. **Access the Hosting Server:**
  - Log onto the hosting server
  - Open the "public\_html" folder
2. **Upload Your Home Page:**
  - This is your personal home page using HTML elements to provide information about yourself. This page will serve as the main entry point to your website. Include a short biography about yourself with: Full name, Student ID, and Department in which you are studying
  - Upload your home page file (index.html) to the "public\_html" folder so it will be accessible to the public
3. **Create Main Folders:** Create three new folders in the "public\_html" directory:
  - **ass** (for assignments)
  - **examples** (for course examples)
  - **project** (for projects)
4. **Create Index Files:** In each of these three folders, create a new file called "index.html," which will be the default web page displayed when visitors browse each folder.
5. **Create Subfolders:** To further organize your content, create a subfolder in each of the three main folders with a number assigned to it:
  - Within the "ass" folder, create a subfolder named "ass1"
  - Inside "ass1," create a file called "index.html"
  - Repeat this process for the other two folders, ensuring the subfolders and files are appropriately named
6. **HTML Examples Folder:**
  - Inside the "examples" folder, create a subfolder called "htmlEx"
  - Upload the HTML examples discussed in the lecture
  - Create an "index.html" file to refer to the examples

## Expected Folder Structure:

## Submission Deadline

**Submission Deadline:** [04/05/2026]. All of your course assignments and the project must be uploaded to CSHost, and **grading will be only for the files uploaded to your folder on the CSHost**. Also, you **must** compress (Zipped) all your files to a file named assOne-stID.zip, where stID is your student ID, and **submit** them to ITC before the due date. **Work will be graded only if it is correctly submitted to both CShost AND ITC.**

## 8. Academic Integrity

All submitted work must be your own. Copying code from classmates, online tutorials, or AI-generated sources and submitting it as your own work constitutes academic misconduct and will result in a mark of zero for the entire assignment. The instructor reserves the right to conduct a brief oral assessment of any submission to verify authorship.
